A gateway to the world of information for the University community a comprehensive range of search services, journals, databases, document delivery, training and support and expert information via a secure website. A highly trained team of information professionals provide quick, efficient, and accurate responses to student and researcher queries. Some copyright of the .Q: How to use GD library to convert a PNG-image to a TGA image I would like to convert some PNG images to TGA images. I've been using GD to do that using imageload() method. But the problem I am encountering is that when I do this \$d = new GD; \$img = \$d->load(\$img_name); \$d->imagepalette(\$gray); (see more code below) The resulting image is like very faded out and has really weird shades. The image is supposed to be black and white and stay that way after it has been converted. The usage of the images I do this on is a company card like this: Inside the card I've placed a PNG file and a TGA file. The PNG file is supposed to be transparent and the TGA file is supposed to be black and white. This is how it should look like. Here is the rest of the code: \$
