A text editor (also called a text editor or a text processing utility) is a computer program that is used to edit or create text files, and in some cases, for preparing text to be used in a piece of software or word processing. A text editor usually makes use of a graphical interface, or a text-based user interface such as a command line. Text editing software uses one or more of the following: A specific markup language. Tags, which represent parts of the text (more on that later). Text flow. Markup language A text editor can be used to create documents in a markup language. Markup language in text editors can be: Software that uses a specific markup language (or code) to describe how a document is organized or formatted. A markup language is any language that describes how a document (such as a web page) should be formatted. For example, a HTML editor describes how a web page should be formatted in HTML. Tags

Simple Text Editor is an easy-to-use and accessible command line text editor. It lets you get things done in the command line, using a text editor or writing a script. In fact, you can use Simple Text Editor (STE) as a calculator if you want. The thing is, STE lets you edit, copy, delete, and paste text anywhere from your computer, without leaving your command line. And you can interact with other users directly from STE as well; you can type your commands and send them to other users, via e-mail. Simple Text Editor is the best tool for editing, scripting and creating new text files with ease. To start editing a file, you just need to type 'vim' or 'gvim' followed by the name of your text file, for example 'vim filename.txt', and edit the file with your favorite editor. You can use the following commands to open your files from the command line: The additional functionality STE provides is consistent and intuitive. It is now easier than ever to write a command line script or interactive application. STE also includes a flexible API so you can use it from your own programs; you can use STE from a C++, Perl, Python, Ruby, Visual Basic and Java program. Simple Text Editor is a program in C, compiled by gcc. The executable STE is an archive file, named ste. STE is not a console application; it is more like a very powerful version of the 'gedit' text editor, and is not included with the distribution. The GUI version is the Gedit editor. STE is under the GPL license. Basic STE Installation STE comes as an archive file. You need to unpack it in a directory. If it was just a plain file, you would unpack it like you do with other archive files. Locate the archive file, then: Move it to a directory named as the program you want to use it for, for example: You can edit the file. You can then save it in the same location as you move it to. In the following example, the archive file is located at /usr/local/ste/ste. First: Launch 'ste' (that is 'ste' at the command line, or from your applications menu, or whatever). Once you have opened STE, it should let you know that it is looking for
